Week - 1

24/03/2026

a, b = Integer
String Name = " "

Eg :- Mark = 70.5
↓ Float

Note : python is an interpreter
↑ convert it into (0 OR 1)
∴ Assignment Statement → Input

Example :

Input
a = input (" Enter a value :")
b = input (" Enter a value :")
R = a+b
print = ("R =", R)
output
Enter a value : 42
Enter b value : 20
R = 4220

GLOBAL APPLIED KNOWLEDGE

If we have to do $k = a/b$

Se. ← integer

```
a = int(input("Enter a value:"))
b = int(input("Enter a value:"))
```

Then we will get result.

∴ If we did

$20/2$ = we will get 9.99 → In decimal

but if $20//3 = 6$ (In integer)

⇒ we use % to get the reminder

Eg:- $23 \% 10$

Reminder = 3

→ comments.

If we need an space between the output we can use (,) or if not then use (+).

- Sep parameter

eg:- print ('25', '09', '2024', sep='/')

output = 25/09/2024

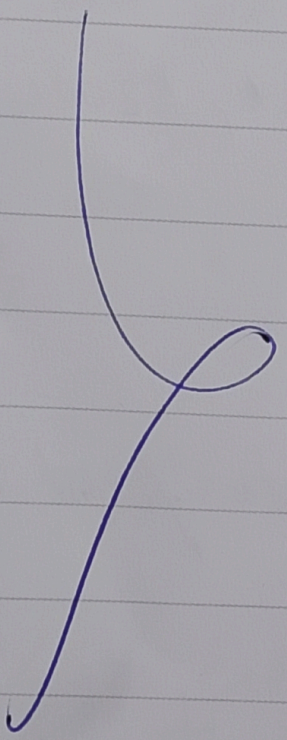

- end parameter: helps to print without a newline.

eg:- print ("welcome to", end=' ')
print ("NIDX")

output: welcome to NIDX

- \n = use for new line
- \t = Horizontal tab.
- \\ = backslash
- \" = double quote

a = a + 1
or
a += 1
or
a++
or
++a

We can use anything all are same.
